Economic & Market Watch Intelligence Brief

Briefing

- Gross domestic product (GDP) per capita is one measure of the average standard of living within a country. It measures, on a per-person basis, the total value of goods and services produced within a country in a year. Adjusting the numbers for purchasing power parity accounts for differences in costs of living across countries. By this measure, the richest country in the world is Monaco, where the GDP per capita is almost two and a half times that of the U.S. and more than eight times the average for the world (Figure 1).
- In the Western Hemisphere, per capita GDP ranges from a low of \$3,300 in Haiti to a high of \$80,000 in the U.S. (Figure 2). Guyana's GDP per capita is almost six times that of Venezuela, even though both economies are based largely on the same geographic area of petroleum reserves. Differences in their economic outputs are largely due to economic mismanagement and more widespread corruption in Venezuela.
- The Asia-Pacific region is home to some of the largest economies and also many of the poorest (Figure 3). North Korea's economy is the sixth poorest in the world (at \$1,500 per person). South Korea's per capita GDP is 36 times that of North Korea's, despite sharing the same language, culture, heritage and (until 1948) history with North Korea.

World's Largest Economies (Billions US\$)

Commentary

Comparing economies requires converting countries' GDPs to the same units. There are two conversions, and they yield different results. One uses the exchange rate. For example, Japan's 2023 GDP was around ¥590 trillion. In 2023, the exchange rate averaged ¥140 to one U.S. dollar. Using this conversion, Japan's GDP was \$4.2 trillion (measured in U.S. dollars).

But exchange rates don't capture differences in costs of living. Purchasing power parity accounts for this. For example, in 2023, one dollar spent in the U.S. purchased about the same as ¥94 spent in Japan. Using this conversion, Japan's GDP was \$6.3 trillion (measured in U.S. purchasing power). Using the exchange rate, the U.S. economy is more than 50% larger than China's. But using purchasing power parity, China's is 25% larger than the U.S. economy.

Finally, while GDP measures the total output of an economy, GDP per capita measures the output per person. For example, China's economy is one of the two largest in the world, but its per capita GDP is 95th. Conversely, Monaco has the highest per capita GDP in the world (almost \$200,000 measured in U.S. purchasing power), but Monaco's economy is around onefour thousandth the size of the U.S. economy. **Snapshots**
